AB The present invention relates to the discovery, identification and
characterization of nucleotides that encode Ob receptor (ObR), a
receptor protein that participates in mammalian **body** weight
regulation. The invention encompasses obR nucleotides, host cell
expression systems, ObR proteins, fusion proteins, polypeptides and
peptides, antibodies to the receptor, transgenic animals that express an
obR transgene, or recombinant knock-out animals that do not express the
ObR, antagonists and agonists of the receptor, and other compounds that
modulate obR gene expression or ObR activity that can be used for
diagnosis, drug screening, clinical trial monitoring, and/or the
treatment of **body** weight disorders, including but not limited

to obesity, cachexia and anorexia.

AB Disclosed are methods for the isolation of primordial germ cells, culturing these cells to produce primordial germ cell-derived cell lines, methods for transforming both the primordial germ cells and the cultured cell lines, and using these transformed cells and cell lines to generate transgenic animals. The **efficiency** at which transgenic animals are generated by the present invention is greatly increased, thereby allowing the use of homologous recombination in producing transgenic non-rodent animal species.

AB The present invention relates to the discovery, identification and
characterization of nucleotides that encode Ob receptor (ObR), a
receptor protein that participates in mammalian **body** weight
regulation. The invention encompasses obR nucleotides, host cell
expression systems, ObR proteins, fusion proteins, polypeptides and
peptides, antibodies to the receptor, transgenic animals that express an

obR transgene, or recombinant knock-out animals that do not express the ObR, antagonists and agonists of the receptor, and other compounds that modulate obR gene expression or ObR activity that can be used for diagnosis, drug screening, clinical trial monitoring, and/or the treatment of **body** weight disorders, including but not limited to obesity, cachexia and anorexia.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides polynucleotides and related polypeptides of the enzyme APAO isolated from *Exophiala spinifera*. Additionally, the polynucleotide encoding for the APAO enzyme can be used to transform plant cells normally susceptible to *Fusarium* or other toxin-producing fungus infection. Plants can be regenerated from the transformed plant cells. Additionally, the present invention provides for expressing both APAO and a fumonisin esterase in a transgenic plant. In this way, a transgenic plant can be produced with the capability of degrading fumonisin, as well as with the capability of producing the degrading enzymes. In addition, the present invention provides methods for producing the APAO enzyme in both prokaryotic and non-plant eukaryotic systems. Methods for detoxification in grain, grain processing, silage, food crops and in animal **feed** and rumen microbes are also disclosed.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CODEN: IVEJAC; ISSN: 0019-6479

PB Indian Veterinary Association

DT Journal

LA English

AB The chem. **compn.** of alligator weed was detd. to explore the possibility of incorporation in the ruminant ration. The crit. amino acids like lysine and methionine were deficient in alligator weed and non-essential amino acids like **glutamic** and aspartic acids were higher. Similar pattern of essential and non-essential amino acids were found in most of the **livestock feeds**. Thus, alligator weed can be incorporated up to 15% in the ration of ruminants.

AB These flood plain meadows are the basic forage source for Western Transbaikal and Northern Mongolia **livestock**, providing hay and pastures. The contents and **compn.** of amino acids were detd. in major species of mesophytic meadows during cutting for hay. Total and essential amino acids were highest in legumes, 84.7-99.0 and 43.7-49.2 g/kg, resp. For the overall forage (of which the legumes were 5%), essential amino acids were 45.9-57.2% of total amino acids. Most species contained 16 amino acids, including 9 essential amino acids. Histidine, methionine, and phenylalanine were low.

TI Nutrient content of hydroponically sprouted barley

AU Peer, D. J.; Leeson, S.

CS Dep. Anim. Poult. Sci., Univ. Guelph, Guelph, ON, N1G 2W1, Can.

SO Anim. Feed Sci. Technol. (1985), 13(3-4), 191-202

CODEN: AFSTDH; ISSN: 0377-8401

DT Journal

LA English

AB Barley grain was sprouted hydroponically in light at 21.degree. for 1-7 days. Samples were freeze-dried, ground to pass a 1-mm screen, and analyzed for proximate nutrients, amino acids, minerals, and fatty acids. During sprouting, wts. of dry matter (DM), starch [9005-25-8] (N-free ext.), and gross energy decreased markedly. A smaller redn. in protein wt. also occurred. Wts. of ash and fat increased slightly and fiber increased markedly with increased sprouting time. Among the amino acids, wts. of cystine [56-89-3], **glutamic** acid [56-86-0], and proline [147-85-3] decreased, and aspartic acid [56-84-8] and alanine [56-41-7] increased. There was a slight gain in Cu, Na, and Zn due to the

mineral content of the water source. The fatty acid concn. showed a significant pos. relation with growth period. Thus, the younger the sprout, the greater its nutrient wt. It would appear that day 1 sprouts are nutritionally superior to day 4 sprouts, which are currently being fed to **livestock**. Field-sprouted grain, which is analogous to day 1 sprouts in terms of gross phys. appearance, would have a minimal loss of nutrients.

DT Journal

LA Russian

AB Anal. of amino acid and vitamin **compn.** of biomass of activated sludge formed during anaerobic-aerobic treatment of meat plant wastewater showed that this biomass can be used as an additive to **livestock feed**. The biomass contains raw protein 48-59, albumin 44-56, fat 4.3-7.8, cellular tissue 6.0-34, and ash 12-24% (based on dry substance). The ash contains P, K, Na, Ca, Fe, Mn, and other trace elements. An amino acid anal. indicated that the dry biomass contains sufficient amts. of all required amino acids, with esp. high concns. of **glutamic** and aspartic acids, on aerobic treatment of the biomass for 3-4 days, the overall content of amino acids remained const., with change occurring only in their relative contents. Such treatment led to partial inactivation of pathogenic microflora and to increased content of the B vitamins.

 LA Croatian
 AB Levels of total amino acids in feces were only 26% lower than in the **feed** of pullets, in layers, 31%. The feces of poultry were particularly rich in glycine, threonine, aspartic acid, valine, lysine, proline and alanine, with small quantities of methionine, phenylalanine, **glutamic** acid, and leucine. The poultry retained 81-4% of methionine, phenylalanine, **glutamic** acid and leucine and 61-75% of glycine, threonine, aspartic acid, lysine and valine from **feed**. Accordingly these amino acids appear in corresponding proportions in the feces. On the av. 76-8% of the total amino acids from **feed** was retained, and the remaining 22-24% was excreted in the feces of chickens. The amino acids found in the feces of poultry were not only the indigestible and unabsorbed remainders of **feed** but also the products of metab. and endogenous secretion which had passed through some processes.
